Post-operative Rehabilitation Protocol

Shoulder Arthroscopic Capsular Release

General Guidelines

- You should plan to begin PT 1-2 days after surgery → The first couple of weeks are very important to maintain the motion gained during surgery
- Contact therapist or physician for questions or concerns

	Range of Motion	Immobilizer	Exercises
Therapy Phase 1 Weeks 0 - 2	Aggressive PROM and capsular mobility in all planes → 3-4x/wk supervised PT	Sling for comfort only until block wears off	Aggressive stretching. Try to minimize lifting with operative arm lce: 20 minutes on, 20 minutes off every hour
Therapy Phase 2 Weeks 2 - 6	Initiate Active ROM as tolerated	Discontinue sling when comfortable	Exercises: Progress scapular stabilizers (protraction, retraction) Modalities: Per therapist – E-stim, Pain-reducing modalities
Therapy Phase 3 Weeks 6+	Full Active ROM	None	Exercises: Continue phase 2. May begin gentle rotator cuff strengthening, though avoid positions of impingement
